

Walk-on gratings, platforms and staircases

... for a safe and convenient access to difficult elevated locations

Walk-on gratings can be combined into platforms, walkways, staircases, overhead passages and other walk-on surfaces. These walk-on structures can be used in any facilities (industrial plants, wine cellars, etc.), where a safe and convenient access to difficult elevated locations is required.

Perforated and sectional construction of the walk-on surface ensures protection against slipping. Guard rails on one or both sides of the walk-on platform and staircases provide for the additional protection and ensure safe movement and work at a height.

The modular construction system offers various possibility of composition of elements. Walk-on constructions can be adapted to the available space and the existing objects in the room.

Together with our customers we prepare a plan and present the project in a detailed three-dimensional model. Already at the very beginning this model offers a precise insight into the construction and shows the adequacy of the proposed solution.

Drainage system

... for a simpler cleaning of cellars and other facilities

Stainless steel drain channels are designed for simple and efficient cleaning in cellars and for accumulating and directing waste water on the floor. All parts are prepared for the installation into the concrete floor. All parts are made of stainless steel AISI 304 (EN 1.3401). The shape and material allow a simple and efficient cleaning and meet the highest hygiene standards.
